PRD Example: Linear Priority Micro-Adjust

Context

Make fine-grained adjustments to priority levels within basic categories. If you implement a stack-ranking system for your tasks and projects, this is specifically made for you!

Problem

A very common use case we encounter is global stack-ranking: customers want to form a stable, opinionated order of priority across all of their backlog items. Today, we provide a global manual ordering feature, which we recommend for these cases.

Key Issues:

- Instability: Manual sort is often unstable. Users often don't treat this ordering with care because it feels low-stakes.
- Local vs. Global Sorting: In other apps, manual sort is often local. Users are often surprised we have global manual ordering.
- Redundancy with Priority Field: Having both manual sort and a priority field creates confusion when trying to create a global priority stack rank.

User Pain Points:

- Requests for "custom priority levels" due to insufficient granularity in the 4 basic buckets
- Requests for custom fields to add a "ranking" column for numerical stack-ranking

Solution

Allow users to adjust and rearrange the relative priority of their issues within a priority bucket through drag-and-drop. This will be recommended as the primary method for all stack-ranking use-cases.

Options Considered But Rejected:

- Custom priority levels - Would encourage too many distinct categories
- Custom fields - Would solve stack-ranking but diverges from Linear's opinionated defaults philosophy

Usage Scenarios

Scenario 1: Project Priority Organization

User can drag issues and projects to desired order within the same priority level, avoiding the complexity of defining new priority levels while maintaining specific ordering.

Scenario 2: Importance Ranking

Instead of using arbitrary integer values, users can visually arrange items by importance, making it more intuitive for team communication.

Implementation Milestones

- **MS1: Internal**
  - Implement drag-and-drop within priority levels
  - Handle priority changes when dropping between different priority sets
- **MS2: Beta**
  - Initialize using existing manual sort index
  - Bootstrap initial microadjust ordering
- **MS3: GA + Changelog**
  - Release alongside project priorities
  - Present cohesive story about Linear's priority system

💡 What Makes This PRD Great

- Clear problem statement with specific user pain points
- Thoughtful consideration of alternative solutions
- Concrete usage scenarios that demonstrate value
- Well-structured implementation plan with clear milestones
- Focus on user experience and intuitive design
